Make the next decision easier.

A cinema experience built around where, when and what to watch.

The challenge

Choosing a film means balancing the story, location, date and available times. Afterglow brings those decisions into one clear sequence, from browsing the programme to reviewing a selected showing.

The design goal

Help someone find a film, compare available times and understand their selection without repeatedly searching for context.

FOCUS

Discovery → selection

Cinema and date → film → screening format → time → showing summary.

MY CONTRIBUTION

Experience & interface

Defined the discovery flow, developed the visual direction and refined responsive screens and interaction states.

Scope: a working discovery and showtime experience. Seat selection, checkout and booking confirmation are outside this version.

From a film in mind to a showing that fits.

The Afterglow flow keeps each decision connected to the next.

01**Set the context**

Choose a cinema and date.

02**Explore films**

Browse or search by title.

03**Compare showtimes**

Review formats and times.

04**Review the choice**

Check the showing summary.

Keep the context visible

Cinema and date carry from the homepage into film details. Returning to the programme preserves those choices, so browsing does not mean starting over.

Give every state a way forward

Search can be cleared, unavailable screenings point to other cinemas, and a selected showing can be changed. These recovery paths are part of the core experience.

Three changes that shape the redesign.

Design priorities for the Afterglow experience; their usability impact remains to be tested.

AFTERGLOW / UPCOMING SCREENINGS

01

Choose the context first

Cinema and date now sit on the homepage and carry into film details, reducing the need to re-enter choices.

02

Make films easier to scan

Consistent rating, runtime and genre information supports comparison. A short logline comes before the full synopsis.

03

Show the next step clearly

Visible showtimes lead to a complete showing summary. Selection is marked with words and a check, as well as colour.

Cinema atmosphere. Clear information.

A dark, warm identity lets film artwork lead while keeping controls consistent.

IMAX

Dolby Cinema

Amber identifies actions and selection; labels and symbols carry the meaning too.

Start with what’s on.

A fixed featured film leads into a compact, searchable programme.

01

Context before content

Cinema and a seven-day selector establish the programme before someone chooses a film.

02

One clear feature

The hero offers a short introduction, four upcoming times and a direct path to showtimes.

03

A programme to browse

Film cards repeat the same metadata order. This week and upcoming screenings remain distinct.

The story and the schedule, together.

A short introduction gives way to visible showtimes, without switching tabs.

01

Read a little or a lot

A one-sentence logline supports a quick decision. The full synopsis is available on demand.

02

Compare formats

Standard, IMAX and Dolby Cinema times are grouped with format descriptions and starting prices.

03

Keep your context

Cinema and date remain available on the film page. Choices carry through navigation in the URL.

Know exactly what you chose.

A ticket-shaped summary turns a selected time into a clear, reviewable plan.

Next: choose your seats

Seat selection is the next stage of this prototype and hasn't been built yet. Nothing has been booked or reserved.

A visible selection

A check and “Selected” reinforce the amber state.

A useful summary

Date, time, estimated finish, cinema, screen and starting price stay together.

An honest stopping point

The interface explains that seats are next and nothing has been reserved.

Same task. Different composition.

Mobile layouts protect reading space and keep the essential choices within reach.

Designed for narrow screens

Hero copy moves below the image, avoiding unpredictable contrast over artwork.

A seven-day grid fits the available width.

Long film titles wrap instead of clipping.

A fixed selected-time bar keeps the choice accessible on the film page.

A dead end should offer a next step.

Search and availability states explain what happened and how to continue.

No matching title

The empty search state keeps the query visible and offers a clear way to reset. When a match is in the other programme, a hint points there.

Not at this cinema

A film remains discoverable even when it is unavailable at the chosen cinema. The screen names the limitation and offers alternative locations.

Other paths considered: placing showtimes in tabs, hiding unavailable films and extending the date strip. The redesign favours visible choices and explicit recovery.

A stronger foundation for the cinema journey.

The redesign makes the route from browsing to a selected showing explicit.

What changed

Cinema and date move earlier.

Films share a scannable information structure.

Showtimes stay visible.

A complete summary confirms the selection.

What the work taught me

The most useful changes were structural: putting decisions in order, keeping context visible and explaining unavailable options. The visual identity supports that sequence without replacing it.

Implementation checks

The development record reports passing functional checks at 390, 768 and 1440 px, a clean type check and build, and no violations in the automated accessibility scans run.

What still needs evidence

No usability study has been conducted. The next step is to observe people finding a film and selecting a showing, including readers with different accessibility needs. Screen-reader, broader browser and real-device checks also remain.

Success to evaluate: can someone choose the right cinema, date and time, then accurately explain their selection?
